Software as a Service for Digital Enterprise Group

Fast and cost effective BI solutions

Baseline Situation

The digital enterprise group is registering strong organic and inorganic growth. It is looking for the simplest BI solution which will minimize own effort while maintaining high data security. The operation of the solution is ISO certified and the reaction times and availabilities are regulated by contract.

Project goals

- Data must remain in Switzerland.
- The solution should be easily expandable as the company is rapidly growing.
- Direct integration into the customer's network infrastructure via VPN.

Benefits to customer

- Very easy to set up and remove.
- Minimum risks to the customer.
- No know-how necessary for the operating the solution.
- No investment costs necessary.

Solution

The solution was made available within a day in a private cloud. It runs a development, test and productive environment within a single cloud environment. As a result, the overall costs can be kept very small. The solution includes a 30-day back-up of data and an additional system back-up. Access to the BI platform can only be provided by the customer's authorized party. The platform itself is directly integrated into the customer's network infrastructure and separated from the environment by firewalls. The infrastructure has been extended several times during operation, which is possible within a few hours without any impact on production.
